

• CROSS-ESTATE DOMAIN RISK REPORT · 2026-10-03

cyber-startups

11 declared domains

Starting from **11 declared domains**, Datazag found **16 across the estate**. The estate grades **B** (24/100). It is single-threaded on **Google** for email / mailbox platform (55%). 44,522 new lookalike domains impersonating the estate's platforms (30d, internet-wide): they target every organization on those platforms, not this estate specifically.

ESTATE DISCOVERED

ESTATE GRADE

B

24/100 across 11 graded domains

ACTIVE EXPOSURE

44,522

platform lookalikes (30d, internet-wide)

LIVE LAPSES

16

0 overdue · 16 due ≤30d

WHAT A CYBER INSURER WOULD NOTE

On the externally observable evidence, an underwriter would weigh accumulation risk on **Google** (55% of email / mailbox platform, hyperscale); **44,522** internet-wide lookalikes of the estate's platforms.

Scope: this assessment covers only what is visible from public DNS and certificate transparency at a point in time. It does not cover endpoint security, network segmentation, identity and access management, patch posture, or physical security — all of which a full underwriting assessment also weighs.

The estate you didn't know you had.

ESTATE FOUND16

Discovery is the headline: how much of the estate carrying your brand extends beyond the list you hold.

11

Domains declared

→

16

The estate Datazag found
declared + discovered across four confidence tiers

DECLARED · 11

The domains you told us about
Your starting list — graded and assessed throughout this report.

STRONGLY ASSOCIATED · 0

High-confidence: you own these
Shared certificate SANs, same MX + SPF, matching registrar/nameserver patterns, redirects, subsidiary-name matches. Graded with the declared estate.

POSSIBLE · 5

Medium-confidence: review these
Lexical similarity, shared infrastructure, partial overlap. Listed but left ungraded (pending confirmation).

DEFENSIVE / ACQUISITION · 0

Consider recovering or monitoring
For-sale, expired, typo-adjacent, old acquired names, and login/payroll/invoice lookalikes. Never graded.

DOMAIN	TIER	CONNECTION EVIDENCE
1fd3f647.sni.cloudflaressl.com	POSSIBLE	On a certificate with ossprey.com
34b5f1fb.sni.cloudflaressl.com	POSSIBLE	On a certificate with mindgard.ai
3d2bbf2c.sni.cloudflaressl.com	POSSIBLE	On a certificate with huntbase.io
9e96c6cb.sni.cloudflaressl.com	POSSIBLE	On a certificate with overmindlab.ai
adacccb0.sni.cloudflaressl.com	POSSIBLE	On a certificate with sitehop.com
osneycapital.com	DECLARED	On your declared list
ploy.io	DECLARED	On your declared list
sitehop.com	DECLARED	On your declared list
strandintelligence.com	DECLARED	On your declared list
refute.com	DECLARED	On your declared list
aisy.ai	DECLARED	On your declared list
overmindlab.ai	DECLARED	On your declared list
huntbase.io	DECLARED	On your declared list
mindgard.ai	DECLARED	On your declared list
ossprey.com	DECLARED	On your declared list
aviel.tech	DECLARED	On your declared list

Grades cover the declared and strongly-associated estate. Possible-tier domains are listed but left ungraded (pending confirmation); defensive / acquisition domains are never graded.

Concentration & posture variance.

ESTATE GRADE
B

Where the estate is single-threaded, and which parts sit below the group standard.

Email / mailbox platform	Google hyperscale		55%	WATCH
Nameserver / DNS provider	Cloudflare hyperscale		60%	WATCH
Registrar	GoDaddy.com, LLC commodity · high exit friction		44%	ELEVATED
Hosting network (ASN)	AS13335 Cloudflare hyperscale		45%	—
Hosting provider	cloudflare hyperscale		83%	WATCH
Third-party vendor (SPF-observed)	Google Workspace commodity · not assessed		55%	HIGH

Mailbox shares are resolved through vanity MX records to the operating provider — a domain fronting Google Workspace behind its own MX counts as Google Workspace concentration.

SEGMENT	DOMAINS	MEDIAN GRADE	VS BASELINE
ns:AWS	3	C	-1 bands
ns:Cloudflare	6	A	baseline
ns:Namecheap	1	C	-1 bands
reg:HOSTINGER operations, UAB	1	B	baseline

INTEGRATION-GAP MONITOR

Baseline grade is **B**; outlier segments are the classic acquired-company integration gap — track them as they converge (or drift) over the hold.

Correlated weakness & active exposure.

SYSTEMIC CONTROLS4

What's wrong in the same way across many domains — and what's actively hitting the estate now.

44,522

new lookalike domains impersonating the estate's platforms (30d, internet-wide)

external_threat.impersonations · confidence = "exact"

The concentration is the finding:

42% targeting Google Workspace

. Exact-match certificates only; lower-confidence candidates are excluded

IMPERSONATING DOMAIN	TARGET	WINDOW	PATTERN
google-feud.ph	Google Workspace	18479 in 30d	Exact platform match
google-bot.com.ph	Google Workspace	18479 in 30d	Exact platform match
google-bnp-paribas-brainchildtech.com.ph	Google Workspace	18479 in 30d	Exact platform match
google-bizum-deliveryhero.com.ph	Google Workspace	18479 in 30d	Exact platform match
amazon-expediaenl.ph	Amazon SES	9574 in 30d	Exact platform match

sitehop.com	ns:AWS	cert_expiring	SOON	Certificate expiring soon: siteb.sitehop.com

1

1 domain(s) expired or unlocked — recover before anything else

HIGH

Expired registrations and absent registrar locks are live takeover windows. Renew and re-lock these before DNS hygiene work.

calendar.overdue × 0 · registrar_lock = none × 1

2

Provider concentration across the estate — 5 single points of failure

HIGH

Top concentrations: Google Workspace 55% (third-party vendor (spf-observed)), GoDaddy.com, LLC 44% (registrar), Google 55% (email / mailbox platform), Cloudflare 60% (nameserver / dns provider). Severity reflects provider resilience, not share alone. *(collapsed from concentration × 5)*

technographic=Google Workspace 55% [commodity] · registrar=GoDaddy.com, LLC 44% [commodity/high-exit] · mailbox=Google 55% [hyperscale] · ns=Cloudflare 60% [hyperscale]

3

Systemic misconfiguration repeats across the estate — fix as a standard

ELEVATED

Most prevalent: CAA record missing (100%), DNSSEC not enabled (82%), DMARC not enforced (36%). These share fixes — see the correlated-weakness rollup and the remediation worksheet (Appendix A), not per-domain tickets. *(collapsed from correlated_weakness × 4)*

correlated_weakness × 4 · see page 4 rollup

4

44,522 new lookalike domains impersonating the estate's platforms (30d, internet-wide)

INFO

Context, not a finding against this estate: these imitate the platforms, so every organization using them sees the same count. Most are Google Workspace lookalikes (42%).

external_threat.impersonations · confidence = "exact"

REMEDIATION WORKSHEET

The fix-by-fix worksheet — pattern-grouped, ordered by admin point, ready to hand to your DNS and registrar teams — is in **Appendix A**.

What happens next.

This report is a point-in-time map. Two channels keep it live.

01

The live impersonation feed

The report is the map; the feed is the tripwire.

Every exact-match certificate for your platforms and brands, delivered to your SOC/SIEM within 5–10 seconds of issuance — the standing exposure on page 4, turned into live events.

Platform & Brand Impersonation Watch — webhook + takedown evidence pack (landing-page screenshot with the brand match highlighted).

02

Continuous discovery & drift

Estate change becomes its own alert stream.

Re-run across the 340M-domain corpus on a cadence: new domains appearing in your estate, segments drifting below baseline, sleeper lookalikes activating — "3 new domains appeared in your estate this week; one is RED."

Runs over time turn this snapshot into a monitored posture with drift/delta alerts.

Move from snapshot to monitored estate.

Wire the feed and schedule continuous discovery — the estate you can't fully see, watched continuously.

Talk to Datazag →

SCOPE & LIMITS OF THIS ASSESSMENT

Grade scope. Declared + strongly-associated domains. Possible-tier listed ungraded; defensive-tier never graded.	Externally observable only. Public DNS + certificate transparency at a point in time. No endpoint, network-segmentation, IAM or patch posture.
Impersonation. Exact-match only; lower-confidence candidates excluded from headline counts.	Corpus. 340M-domain Datazag corpus + certificate-transparency feed.

Key terms: **Concentration** — share of the estate on one provider. **Resilience tier** — how survivable that provider's failure is. **Posture variance** — segments below the group baseline. **Exact match** — a certificate impersonating your platform, not a fuzzy typosquat.

Remediation worksheet.

FIX PATTERNS5

Grouped by fix pattern, ordered by admin point — one team's work batches into one change window. Hand to your DNS & registrar teams.

ADMIN POINT
Cloudflare
13 change(s) batch here

ADMIN POINT
AWS
9 change(s) batch here

ADMIN POINT
Namecheap
3 change(s) batch here

1

Recover expired / unlocked domains

NOW

Expired registrations and absent locks are live takeover windows — recover these before any DNS hygiene work.

at the registrar: renew, then enable
clientTransferProhibited · clientDeleteProhibited · clientUpdateProhibited

DOMAIN	ADMIN POINT	NOW	FIX
☐ osneycapital.com	Amazon Registrar, Inc. · ns:AWS	no registrar lock	renew + set registrar locks

2

Enforce DMARC

NOW

DMARC lets you reject mail spoofed as your domain. Staged: publish p=none with rua first to observe, then move to enforcement. **End state:** p=reject once rua confirms all senders.

_dmarc.. TXT "v=DMARC1; p=none; rua=mailto:dmarc@"
then, once rua confirms your senders:
_dmarc.. TXT "v=DMARC1; p=quarantine; rua=mailto:dmarc@"

DOMAIN	ADMIN POINT	NOW	FIX
☐ osneycapital.com	AWS · ns:AWS	p=none (monitor only)	p=quarantine
☐ ploy.io	AWS · ns:AWS	p=none (monitor only)	p=quarantine
☐ refute.com	Cloudflare · ns:Cloudflare	p=none (monitor only)	p=quarantine
☐ ossprey.com	Namecheap · ns:Namecheap	p=none (monitor only)	p=quarantine

3 Tighten SPF to hard-fail

NOW

SPF declares which servers may send as your domain. Move to hard-fail (-all) once DMARC reports confirm your legitimate senders; non-sending domains can go to -all immediately. **End state:** -all once DMARC confirms senders.

```
# target apex record (after DMARC confirms senders):
v=spf1 include:<your-sender> -all
```

DOMAIN	ADMIN POINT	NOW	FIX
☐ ploy.io	AWS · ns:AWS	soft-fail (~all)	-all after DMARC confirms senders
☐ overmindlab.ai	Cloudflare · ns:Cloudflare	soft-fail (~all)	-all after DMARC confirms senders
☐ strandintelligence.com	Cloudflare · ns:Cloudflare	soft-fail (~all)	-all after DMARC confirms senders
☐ aviel.tech	DNS zone host · reg:HOSTINGER operations, UAB	soft-fail (~all)	-all after DMARC confirms senders

4 Publish CAA records

SOON

CAA reduces the set of certificate authorities that may issue for your domains.

```
. IN CAA 0 issue "<your-ca>"
. IN CAA 0 iodef "mailto:security@"
```

DOMAIN	ADMIN POINT	NOW	FIX
☐ osneycapital.com	AWS · ns:AWS	no CAA record	issue "<your-ca>"
☐ ploy.io	AWS · ns:AWS	no CAA record	issue "<your-ca>"
☐ sitehop.com	AWS · ns:AWS	no CAA record	issue "<your-ca>"
☐ aisy.ai	Cloudflare · ns:Cloudflare	no CAA record	issue "<your-ca>"
☐ huntbase.io	Cloudflare · ns:Cloudflare	no CAA record	issue "<your-ca>"
☐ mindgard.ai	Cloudflare · ns:Cloudflare	no CAA record	issue "<your-ca>"
☐ overmindlab.ai	Cloudflare · ns:Cloudflare	no CAA record	issue "<your-ca>"
☐ refute.com	Cloudflare · ns:Cloudflare	no CAA record	issue "<your-ca>"
☐ strandintelligence.com	Cloudflare · ns:Cloudflare	no CAA record	issue "<your-ca>"
☐ aviel.tech	DNS zone host · reg:HOSTINGER operations, UAB	no CAA record	issue "<your-ca>"
☐ ossprey.com	Namecheap · ns:Namecheap	no CAA record	issue "<your-ca>"

5 Enable DNSSEC

MATURITY

DNSSEC cryptographically signs your DNS records. Gold-standard; plan it — its absence does not create exploitable risk today.

```
# enable signing at the DNS provider, then publish the DS at the registry
```

DOMAIN	ADMIN POINT	NOW	FIX
☐ osneycapital.com	AWS · ns:AWS	zone unsigned	sign zone + DS at registry
☐ ploy.io	AWS · ns:AWS	zone unsigned	sign zone + DS at registry
☐ sitehop.com	AWS · ns:AWS	zone unsigned	sign zone + DS at registry
☐ aisy.ai	Cloudflare · ns:Cloudflare	zone unsigned	sign zone + DS at registry
☐ mindgard.ai	Cloudflare · ns:Cloudflare	zone unsigned	sign zone + DS at registry
☐ overmindlab.ai	Cloudflare · ns:Cloudflare	zone unsigned	sign zone + DS at registry
☐ strandintelligence.com	Cloudflare · ns:Cloudflare	zone unsigned	sign zone + DS at registry
☐ aviel.tech	DNS zone host · reg:HOSTINGER operations, UAB	zone unsigned	sign zone + DS at registry
☐ ossprey.com	Namecheap · ns:Namecheap	zone unsigned	sign zone + DS at registry

Now / Soon / Maturity

Fix urgency: baseline gaps now, advanced controls soon, gold-standard controls at maturity.

Admin point

The zone host or registrar where a change is made — the batching and ticketing unit.

rua

The DMARC reporting address; confirm senders here before tightening policy.

-all / ~all

SPF hard-fail vs soft-fail; hard-fail rejects unlisted senders.

VERIFICATION

Each fix is externally observable on the next run or feed event — this worksheet is checkable, not just advisory. Sequence: recovery/locks first, then baseline email controls, then hardening.
